Geology and Geomorphology

Survey Photographic Record

Survey Date: Tuesday 9th August 2011
Time: 2.30 - 4.30 pm
Surveyors: Jenny Higgs

The photographic ID number refers to comments as recorded in ASMRP 6.

Photographs were taken with varying lens lengths to provide an understanding of the geology and geomorphology and are for reference purposes only.
Photo Geo 6.1
The glacio-lacustrine deposits have formed an area of flat and relatively poorly-drained land, underlain by clay soils.
There are no distinguishing geomorphological features on the site and the surrounding land drainage is artificial.
The surrounding buffer zone consists of the same characteristics as Photo Geo 6.2.
ASMRP 6 (Site 6)
Quaternary Brick Clay Resources
Monk Fryston, Yorkshire

Landscape

Survey Photographic Record

Survey Date: Tuesday 9th August 2011
Time: 2.30 - 4.30 pm
Surveyors: Jayne Garbutt & Lucinda Weymouth

The photographic ID number refers to comments as recorded in ASMRP 6.

Photographs were taken with varying lens lengths to provide an understanding of the landscape and are for reference purposes only.
Survey Location 1, SE 5221 29470, the low lying flat landscape affords long views in all directions with varying boundary features. The open views are interrupted by vertical elements such as shelterbelts, pylons and power stations.

The A63 provides the northern boundary to the site.
Photo: Lan 6.3
The surrounding buffer zone consists of the same characteristics as the sample site.

Natural Environment

Survey Photographic Record

Survey Date: Wednesday 10th August 2011
Time: 10.00 – 12.00 pm
Surveyors: Sam Griffin

The photographic ID number refers to comments as recorded in ASMRP 8.

Photographs were taken with varying lens lengths to provide an understanding of the natural environment and are for reference purposes only.
Many of the hedgerows in this area are planted in association with dry-stone walls and low hedge banks. Many are species rich and are likely to be of some age.

Ancient woodland exist either side of the sample area and the small areas. Broadleaved woodland within the sample area is mature and contains trees with features likely to be used by roosting bats. Furthermore much of the woodland exists within abandoned quarries with exposed faces which are likely to be significant for bats.

ASMRP 8, Site 8: Jurassic Limestone Resources
Natural Environment Photographic Record
A number of hedgerows have been removed from fields in this sample area.

Surveyors: Jayne Garbutt & Lucinda Weymouth

The photographic ID number refers to comments as recorded in ASMRP 14
Photographs were taken with varying lens lengths to provide an understanding of the landscape and are for reference purposes only.
Photo: Lan 14.1
Survey Location NZ 06822 06688. Undulating high moorland with contained by the rolling hill tops. Distant views afforded (when the cloud lifted to the south). The sample area is actively managed gorse moorland, with mostly ground level vegetation. Trees are restricted to the areas of shelter within the steep valleys or as shelterbelts for the isolated, exposed farmsteads. Field boundaries consisting of stone walls are predominantly limited to around the farmsteads.
The sample and buffer area are crossed by public rights of way and most of the area is also Open access land. The undulations in the landform are just apparent in the photograph.

The rectangles of heather management for grouse create a distinctive pattern within the landscape.
The area is also rough grazed.

Long views looking south across the buffer area.
